IDAN HUR

Backend Engineer · .NET & C# · Cloud & Distributed Systems
Idan12060@gmail.com | 050-309-5593 | idan-hur.com | GitHub | LinkedIn

PROFILE

Backend engineer with 2+ years building and maintaining production systems for critical infrastructure — power-grid IoT monitoring used by electric utilities across intercity networks. Specializes in C# and .NET, with strong experience in REST API design, authentication, cloud-native architectures, and modernizing legacy systems under live production constraints. Comfortable across the full stack, with a clear backend focus.

EXPERIENCE

Megger *Dec 2023 – Present*

Fullstack Engineer (Backend-focused) · Dec 2024 – Present

- **Built an AI-powered fault detection feature end-to-end:** integrated ML model output via API, implemented fault classification logic and grid section identification, and delivered site-wide frontend and backend changes to surface the feature across the platform.
- **Led a full-stack framework migration (.NET 6 → .NET 9, React 16 → 18)** on a live SaaS platform serving electric utilities — zero production incidents through rigorous staged testing and breaking-change resolution.
- **Designed and secured REST APIs** using JWT, OAuth 2.0, and role-based access control for an IoT platform monitoring fault detection across intercity power-grid infrastructure.
- **Stabilized a React frontend with accumulated technical debt:** untangled machine-specific local dependencies to make the build fully reproducible and audit-clean, and resolved pre-existing runtime errors.

Software Engineer · Dec 2023 – Dec 2024

- **Cut device calibration test time from 23 min to 14 min** by rewriting synchronous test workflows as async in .NET Framework 4.8; also resolved recurring hardware communication failures that were causing multiple test restarts per day.
- **Eliminated manual SQL Server update steps** by implementing Entity Framework migrations — significantly reducing deployment time and removing a recurring source of human error.
- **Built a fully functional Docker containerization POC** for the production backend as a self-initiated project, demonstrating a viable path to containerized deployments.

PROJECTS

Distributed Car Auction Platform *Personal Project*

View on GitHub →

- **Architected 5–6 independent microservices** using .NET Core with PostgreSQL, MongoDB, RabbitMQ, and Kafka for async messaging and event-driven communication.
- **Implemented production-grade auth (OAuth 2.0, IdentityServer) and real-time updates via SignalR;** deployed on Kubernetes with API gateway and reverse proxy (YARP), and a Next.js frontend.

SKILLS

Languages: C# (ASP.NET Core, .NET 6–9, .NET Framework), JavaScript / TypeScript, Python, Bash, Java
Backend: REST API design, Microservices, Async programming, OOP, OAuth 2.0 / JWT, Entity Framework, SignalR
Messaging & DBs: RabbitMQ, Kafka, PostgreSQL, MongoDB, MySQL, SQL Server
DevOps & Cloud: Docker, Kubernetes, AWS EKS, Jenkins, CI/CD
Frontend & Tools: React, Next.js, Tailwind, Bootstrap, Git, Linux

EDUCATION

Afeka Tel Aviv Academic College of Engineering *2019 – 2023*

B.Sc. Software Engineering · Specialization in Machine Learning & AI · Smart Up honors program

LANGUAGES: Hebrew (Native) · English (Fluent)
